

## Community Networks Overview

Once access is in the local community, the N50 looks to expand the community network by the deployment of extended Wi-Fi networks, making use of signal booster kits and solar power and access points to extend networks from a local school or clinic throughout the community center. This design enables community members to access the community network and available content, and deep cache content stored at the edge without the need to utilize precious top-up minutes for additional internet data.

We have successfully deployed multiple solar-powered community networks, and you can read more details in the whitepaper on the next page.
