

Laser Tattoo Removal - Aftercare

- The tattoo removal laser treatment may create a superficial burn wound.
- There is immediate whitening of the treated area, which usually lasts for several minutes.
- Many clients then develop blisters, crusts, or scabs within 8-72 hours, which may last for 1-2 weeks or more. Some patients may experience bruising or swelling.
- The treated areas may be pink or pale after the scab separates.
- Scarring, which can be hypertrophic or even keloid, can occur but is very rare. Loss of skin pigment in the treated area can occur and is temporary except in very rare cases.
- Healing is usually complete within 4 weeks, although this may vary. Keep the treated area clean and dry while it is healing.
- Clean the area gently with soap and water and then pat the area dry.
- You may apply a thin coating of antibiotic ointment (we recommend Savlon healing gel) up to three times a day for 3 days while the area is healing, and you should keep the area covered with a sterile dressing for those 3 days. Blistering is common and is likely to occur 8 hours after your treatment. Do not be alarmed, blisters heal very well and are part of the normal healing process. They indicate your immune system is healing the area and beginning to remove the ink from your tattoo.
- It is natural for blisters to pop, and this helps the skin to heal faster in many cases. Continue to put antibiotic ointment over the blisters once they have popped for at least 24 hours.
- Do not pick at the scab or allow the skin to become scraped, as this may result in infection and scarring.
- Shaving should be avoided in the treated area until it is completely healed.
- Feel free to shower 2 hours after the treatment but take care to avoid high pressure water hitting the treated area. Baths, hot tubs, swimming pool, or any form of soaking are not recommended until all blistering and scabbing are completely healed, as they may increase the risk of infection.
- Exercise is generally safe after treatment, considering the other after care instructions provided here.
- Wear a sun block with an SPF of 25 or higher over the area for 3 months following the treatment. Do not wear makeup or any cream or medication on or near the treated area unless recommended for 48 hours.
- Try to wear loose clothing to minimise rubbing or irritation to the area.

Pain relief

- You may apply cool compresses as necessary for 24 hours after the laser treatment to help reduce discomfort and inflammation.
- You may take painkillers but avoid aspirin (it can increase the risk of bruising and/or bleeding.)
- Itching is very common due to the dehydrating effect of the laser treatment.
