

Network and Internet Overview

The N50 Project has partners and agreements to provide almost whatever network solution is most optimal for the community. This includes LEO Satellite (Starlink), GEO backhaul, Fiber, P2P, Mesh, and more. We have deployed hundreds of solutions around the globe and will assess the right solution for the community's needs.

Deep caching and forward caching are excellent solutions for rural markets. These solutions, designed and deployed by the N50 Project, enable the community to conserve precious data usage by auto caching at the edge content useful to the community.
